DESCRIPTION

The SM811 two wire mV/TC transmitter receives signals from thermocouples or other millivolt sources and provides a proportional 4 to 20 mA output signal. Because the SM811 is a two wire device, a single pair of twisted copper wires are all that is required to provide power to the unit as well as to carry the output current.

The SM811 is field calibratable, accepting inputs from type J, K, E, R, S & T thermocouples, with millivolt spans ranging from 4 to 64 millivolts. Thermocouple types and ranges are selected using a 6 position DIP switch and final calibration is accomplished by means of multiturn zero and span potentiometers. The zero pot provides an offset adjustment of $\pm 25\%$ of the span. The SM811 is provided with upscale thermocouple break indication. Four voltage input models are also available, accepting inputs ranging from 4 to 64 mV to 4 to 64 volts.

Input spans for voltage input models

NOTES:

- All input ranges start at 0 millivolts (or 0 °c) with an offset adjustment of approximately $\pm 25\%$ of the millivolt span, using the zero potentiometer.
- Table 1 lists maximum and minimum spans for each switch setting. FOR EXAMPLE with switches 4, 5 & 6 in the on position, the input range can be set from 0 to 4 mV up to 0 to 8 mV using the span potentiometer.
